

# For the Love of Nature...

## Vote YES on SB 32

California's climate policies aren't just about renewable energy and smarter transportation options. California's natural and working lands are a key part of curbing greenhouse gas emissions - these landscapes are the state's only asset that actually removes greenhouse gases from the atmosphere.

Even more importantly, restoring and improving the management of our rural and urban forests, farms, wetlands and other natural areas are vital preparation for the more extreme weather events, increasingly intense fires, and rising seas caused by climate change.

Actions that help our lands to better capture and store carbon from the atmosphere, while simultaneously advancing adaptation efforts, are among the most cost-effective steps we can take to address the climate challenge.

California's efforts to improve our natural and working lands are largely driven by our climate goals. Absent targets for 2030, and related programs that support investments in our forests, wetlands, farms, rangelands, local parks and urban forests, we will not succeed in preparing our Golden State and its natural resources for climate change. We will also miss out on opportunities for cleaner water, cleaner air, healthier and more productive farmland and expanded green spaces for urban and underserved communities.

**Please vote YES on SB 32!**
