Tree  
Ambassadors: An  
example of  
socio-ecological  
research and  
community  
engagement

Objectives:

- ✓ Socio-ecological systems (SES) theory
- ✓ Examples of SES research in urban forestry
- ✓ SES research and Tree Ambassadors

# Social- Ecological Systems

*Can better understand and communicate how the biophysical, socioeconomic, and political systems are related*

- Make relevant the relationship between humans and nature
- Things interact “dynamically” and change (space and time)
- These systems are complex, but are adaptable and can be defined by boundaries and processes
- Breaks ‘disciplinary silos’: *Interdisciplinary* → *Transdisciplinary*

# Cities and Urban Forests are Ideal Social-Ecological Systems!

Highly complex anthropogenic & “natural” systems with pressing problems in unsustainability

“Ecology” *in* cities

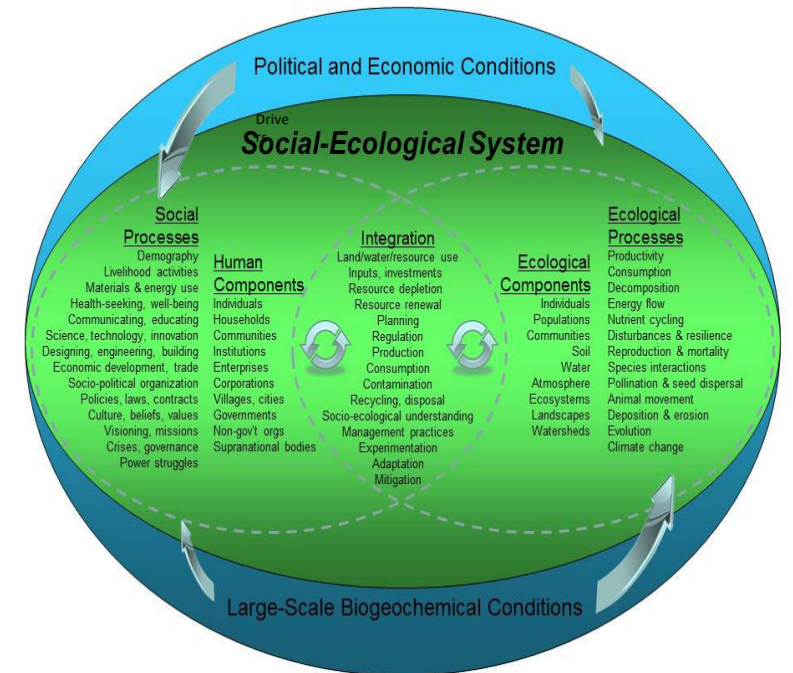

Biophysical environments, soils, vegetation, fauna y humans (e.g., urban ecology)

“...ology” *of* cities

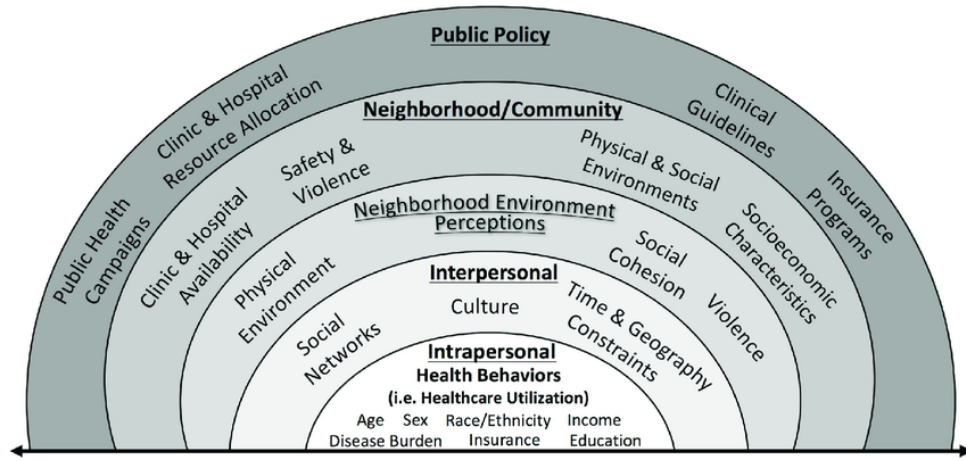

Systems approach to understand multiple social, ecological, environmental economic processes (e.g., Green infrastructure, ecosystem services)

“...ology” *for* cities = Solutions

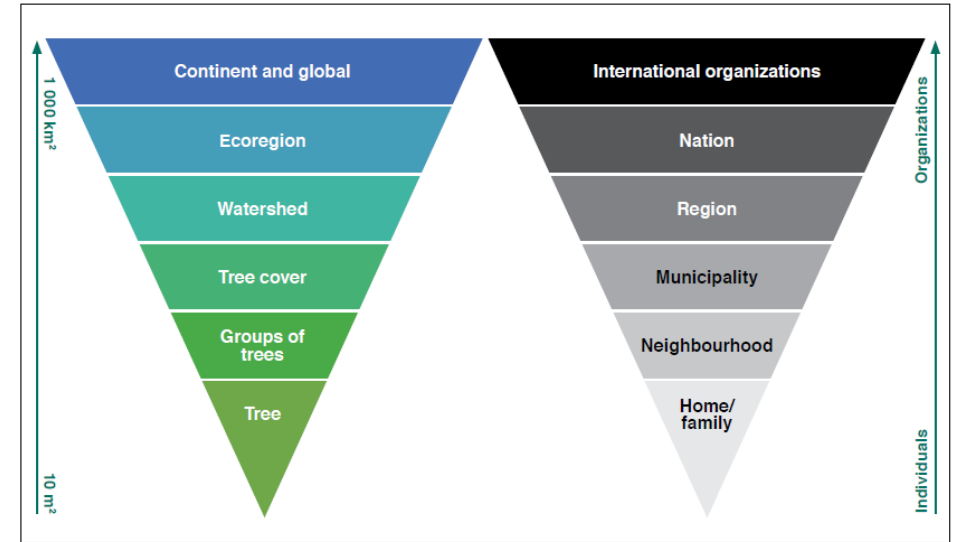

-> Nature-Based Solutions

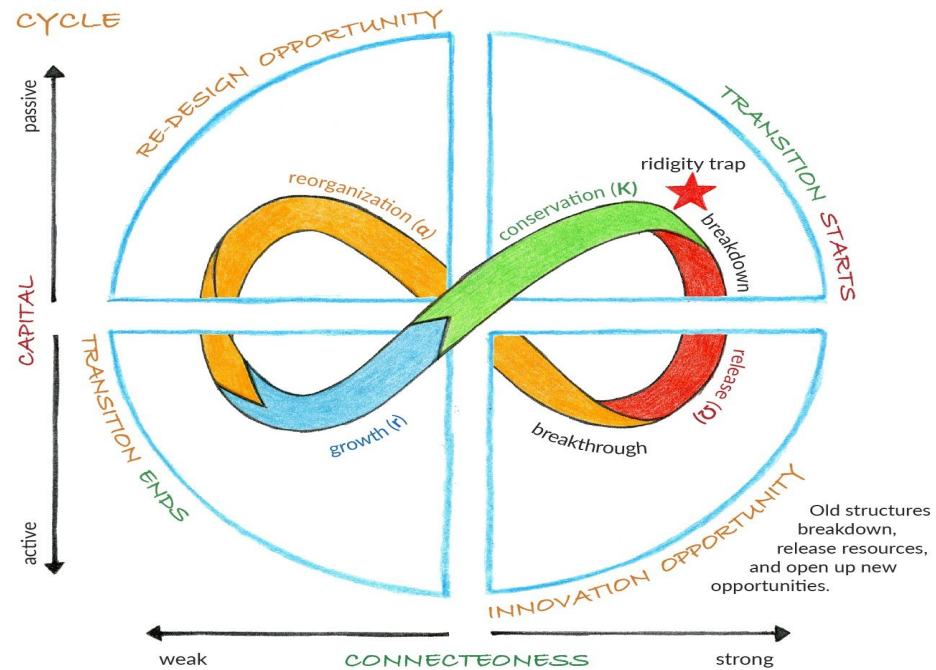

# The socio-ecological model for health behavior

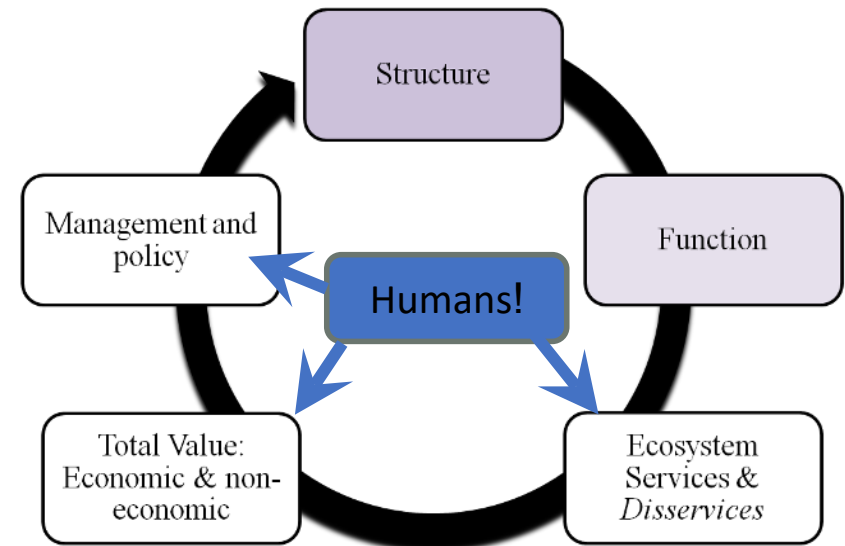

# Matching ecological and societal scales

## THE ADAPTIVE CYCLE

## Urban ecosystem services cascade

# “Urban Forestry” has a long history of doing this

“...all trees in a city in its broadest sense.... includes trees in parks, private gardens, streets, around buildings, on wasteland, and in existing woodlands..” (NUCFAC)

## HUMAN RESPONSES TO VEGETATION AND LANDSCAPES

ROGER S. ULRICH

Department of Geography, University of Delaware, Newark, DE 19716 (U.S.A.)

(Accepted for publication 27 August 1985)

### ABSTRACT

Ulrich, R.S., 1986. Human responses to vegetation and landscapes. *Landscape Urban Plann.* 13: 29-44.

The rapidly expanding research record concerning aesthetic, emotional and physiological response to visual landscapes is summarized, with emphasis on aesthetic preferences for views containing trees and other vegetation. The survey is set within a conceptual perspective suggesting that affective responses such as aesthetic preference are central to a landscape observer's thoughts, conscious experience and behavior. Substantial progress has been made in developing models that relate aesthetic responses to specific visual priorities of environments. When aesthetic preferences are compared for urban and unsectacular natural views,

## THE CONTRIBUTION OF TREES TO RESIDENTIAL PROPERTY VALUE

by Dominic J. Morales

**Abstract.** This study was conducted to determine whether or not trees contribute to residential property value and the extent of that contribution in the areas observed. To accomplish this, homes were observed with a substantial amount of mature tree cover and homes were observed without tree cover. It is realized that there are other variables that contribute to residential property value and this information was obtained from tax cards on file in the town tax assessor's office. All possible variables were noted for each house observed including the sale price. Factor and multiple regression analysis was used to determine the effect of the independent variables on the dependent variable which is sales price of the house. The results showed that trees do contribute to property value in the areas observed. By using the equation formulated by the regression analysis, we can predict the value of homes. From the values derived by the regression analysis, it was found that good tree cover added \$2,686 (or six percent of the total) to the property value of the homes observed.

Individuals in the field of tree evaluation can easily arrive at and agree upon the value of a tree as it relates to timber use and aesthetic shade value. Formulas have been developed for calculating such values (1).

The U.S. Forest Service in a study conducted in

property without (2). This study is directed to help narrow some of these discrepancies by developing a methodology which can provide some insight to the problem of tree cover as a contributing factor in residential property value.

### Methodology

**Sample Selection.** The object of this study is to measure the contribution of trees to residential property value. One method of accomplishing this is to observe houses with and without mature tree cover and observe how this affects the sale price of these houses.

As an initial step in the development of this study, a test area had to be designated. The town of Manchester, Connecticut, was selected. Manchester is a suburban town located southeast of the city of Hartford. As a means of becoming familiar with certain neighborhoods in the test area used to aid in selecting representative areas, local real

Would you vote for this neighborhood urban forest program? Yes  No

# Can people value and identify benefits and costs from urban forests and different tree types?

## Study 1 (Tradeoffs)

- ▶ Value: Property value > Tree condition > shading
- ▶ Prefer programs that cost < \$7.00 per month + maintaining good condition trees + provide high shade
- ▶ Identify differences between ES from their property vs neighborhoods
- ▶ People can discern trade-offs between ecosystem services & disservices

Consumer demand for urban forest ecosystem services and disservices: Examining trade-offs using choice experiments and best-worst scaling

José R. Soto<sup>a,\*,1</sup>, Francisco J. Escobedo<sup>a,\*,1</sup>, Hayk Khachatryan<sup>a,1</sup>, Damian C. Adams<sup>a,1</sup>

## Study 2 (Functional traits)

- ▶ 4 classes of residents identified; no 'average' resident'
- ▶ No one size fits all tree planting program exists (context)
  - ▶ 1 group (of 4) preferred exotic over native
  - ▶ 3 of 4 classes prefer high diversity in types of trees
  - ▶ Younger, pro environment; WTP \$32/mo to avoid exotic trees

Heterogeneous preferences and economic values for urban forest structural and functional attributes ☆

# #3: Taking on the Mayor of Bogota, Colombia (Using Municipal tree inventory and crime data, statistics & transdisciplinary research)

## Tweets from the former Mayor of Bogotá Enrique Peñalosa

*“Park design criteria in north Bogota is that no laborer can play soccer at lunch...they fill them with trees and no one goes”*

*“In colder cities like Bogota too many trees in parks makes them dark and cold and they scare people”*

Fig. 2. (A) Spatial distribution of model residuals, and (B) empirical and robust semivariograms of model residuals.

- Fewer homicides occurred in public treescapes with taller trees and higher tree density.
- Overall average treescape height had a strong negative effect on homicides.
- Amount of public green space and basal area were not related to homicide occurrence.

## Trees and Crime in Bogota, Colombia: Is the link an ecosystem disservice or service?

# Tree Ambassador / Promotor Forestal program

**“The Tree Ambassador / Promotor Forestal Program is a grassroots, bilingual community organizing program dedicated to amplifying community voices and planting and caring for trees in historically disinvested, heat vulnerable communities in Los Angeles.”**

# Tree ambassador program 2021-2022 (pilot round)

Under-resourced communities tend to live in neighborhoods that have lower tree canopy and are hotter

## Audience

- 12 community members in L.A. neighborhoods impacted by urban forest inequity

## Purpose/ Objective

- 10-month community organizing program to hire and train Tree Ambassadors
- Equip trainees to engage their neighbors to steward trees and to understand and reduce the risks of extreme heat

## Research

- Technical assistance/translation, program evaluation, data analysis,
